TAGGO

UX / PRODUCT DESIGN CASE STUDY WORKBOOK

A practical guide to turning your existing ride-hailing app screens into a clear, honest, interview-ready case study.

Your goal

Explain the problem you worked on, what you personally contributed, why you made key decisions, how you worked, and what you delivered. You do not need to redesign the whole app. You need to make your design thinking visible.

What we know about your project so far

• Project: Taggo, a ride-hailing app designed around familiar booking patterns used by services such as Careem and Uber.

• Duration: approximately six months, based on what you previously shared.

• Design direction 1: put important booking interactions and destination suggestions within easier thumb reach to support one-handed use.

• Design direction 2: improve pricing transparency by making the fare clear before a user confirms a ride.

• Important: these are the decisions you described. Do not claim research findings, usability improvements, business results, or measured time savings unless you have evidence.

Use this workbook as a checklist. Fill in the answers from your real project. If you do not know an answer or did not measure something, say so and explain what you would test next.

Prepared: 26 October 2026

1. Recommended case study structure

Aim for a clear story, not a long report. A recruiter should be able to understand the project quickly and then explore the details.

Section	What to include
01 — Overview	Product, context, duration, team, your role, responsibilities, and the parts you personally owned.
02 — The problem	Describe the specific user difficulty and why it mattered. Separate observed evidence from assumptions.
03 — Users and context	Who the intended users were, in what situations they would book, and what constraints mattered (for example, carrying items while using a phone).
04 — Research and evidence	Competitor review, interviews, surveys, analytics, usability tests, stakeholder input, or desk research—only the methods you actually used.
05 — Key insights	List the strongest findings or design hypotheses. Label assumptions as assumptions, not research findings.
06 — Design goals	State what the experience should help users do, such as book with fewer awkward reaches or understand the fare before confirming.
07 — Exploration and decisions	Show alternatives, sketches, wireframes, flows, or trade-offs. Explain why you chose the final approach.
08 — Final solution	Show annotated screens and explain the important interactions: destination entry, saved places, suggestions, fare display, and confirmation.
09 — Validation and outcome	Report testing or product results if available. If not, say what remains unvalidated and how you would test it.
10 — Reflection	What you learned, what you would change, and what you would do next.

Suggested length: enough to show your thinking, often around 6–10 well-structured sections/screens of narrative. Quality and clarity matter more than hitting a page count.

2. Draft the project overview

Fill in these details before writing paragraphs.

- ■ Project name and one-sentence description
- ■ Project dates and duration
- ■ Your exact role and what you personally owned
- ■ Team members and collaborators (if applicable)
- ■ Platform and target market
- ■ Features included in your scope
- ■ Constraints: time, technology, business requirements, or dependencies

Starter template — edit every bracketed item:

"Taggo is a [type of product] for [intended users/market]. Over approximately six months, I worked as [your role] with [team/collaborators]. I was responsible for [specific responsibilities]. This case study focuses on [feature/problem area] and explains how I approached [design challenge]."

3. Write the problem statement

Keep the problem specific. Do not say that Careem or Uber definitely have a problem unless you have evidence for that claim. You can explain that you used their familiar interaction patterns as a benchmark while identifying opportunities for Taggo.

Possible working draft — use only if it accurately reflects your project:

"For Taggo, I explored how to make ride booking easier for commuters who may be using their phone with one hand, while also making the fare clear before they confirm a ride. I focused on reducing awkward reach during destination selection and helping users understand the price earlier in the flow."

Answer these questions:

- ■ What exact user problem did you observe, hear about, or hypothesize?
- ■ Where in the booking flow did it happen?
- ■ Who was affected, and in what situation?
- ■ What evidence supports the problem? If none, label it a hypothesis.
- ■ Why did this matter to the user or business?

4. Explain your research honestly

Do not retroactively claim you conducted research if you did not. Choose what actually happened and describe it clearly.

- ■ I reviewed competitor apps (name the apps, date/period, and what I compared).
- ■ I interviewed users (number, recruitment, questions, and key themes).
- ■ I ran a survey (audience, number of responses, and relevant findings).
- ■ I tested prototypes (participants, tasks, observations, and changes made).
- ■ I reviewed analytics, support feedback, or existing research (source and findings).
- ■ I spoke with stakeholders or developers (who, what I learned, and how it affected design).
- ■ I mainly used my professional judgment and assumptions; these still need validation.

If you relied on assumptions, you can write: "At this stage, the design direction was based on competitor review and design hypotheses rather than formal user testing. I would validate it through one-handed usability tasks and fare-comprehension testing." Use that wording only if it accurately describes your process.

5. Show the design reasoning

Decision A — One-handed booking

• Show the original or reference pattern you compared, if you can do so fairly and accurately.

• Show Taggo's destination-entry screen and point out the thumb-reachable controls.

• Explain why suggestions and saved places are available at that point in the flow.

• Describe the trade-off: what had to move, shrink, or become less prominent to make the layout work?

• Do not claim it saved time unless you measured task completion time.

Decision B — Price transparency

- Show when and how the fare appears before confirmation.
- Explain what the price communicates and whether any conditions or variable charges are disclosed.
- Show the old and new approach only if you have both and the comparison is accurate.
- Explain the design trade-offs and how you would test whether users understand the fare.

For every key screen, answer: What was the user trying to do? What was difficult? What did I change? Why did I choose this solution? What evidence supports it?

6. Validation and impact

Separate what you delivered from what you proved. A completed design is a deliverable; a usability or business improvement requires evidence.

If you have results

- State the metric or observation and how it was measured.
- Give the sample size, timeframe, and relevant context.
- Explain what changed as a result.
- Do not imply that a small test proves all users will behave the same way.

If you do not have results

Say that formal validation was not conducted or that results were unavailable. Then propose a realistic validation plan.

Potential next tests for Taggo

• One-handed task test: ask participants to enter a destination and select a saved place while holding the phone naturally. Observe reach difficulty, errors, and completion.

• Fare comprehension test: show the fare and ask participants to explain what they expect to pay and what conditions might change the amount.

• Compare a prototype with the previous design, if a previous design exists. Record task success, errors, time, and participant feedback.

• Recruit a small, relevant group for exploratory usability testing; clearly label findings as qualitative rather than representative of the entire market.

7. Case study writing checklist

- The opening tells the reader what the product is and what problem this case study covers.
- My role and individual contribution are explicit.
- The problem is supported by evidence or clearly labelled as a hypothesis.
- Research methods and findings are accurate.
- I show alternatives or trade-offs, not only final screens.
- Screens have captions or annotations explaining key decisions.
- Accessibility and one-handed use are explained in context, not just named as principles.
- Pricing transparency is shown in the actual interface.
- Outcomes are measured, cited internally, or clearly described as unvalidated.
- I include one honest reflection or next step.
- The page works on mobile and desktop, with no broken links or template placeholders.
- Text is concise, readable, and free from spelling and grammar errors.

8. A practical work plan

Work session	Task	Done when…
Session 1	Collect existing Taggo screens, notes, flows, and project facts.	You can explain the project and your role accurately.
Session 2	Write overview, problem, users, and constraints.	A reader understands the challenge in under a minute.
Session 3	Document actual research, assumptions, and insights.	Every claim has a source or is labelled a hypothesis.
Session 4	Annotate the one-handed flow and pricing screens.	Each major decision has a clear rationale.
Session 5	Add validation, outcome, reflection, and publish.	No invented metrics; mobile page checked.

9. Portfolio review checklist before applying

- ■ The home page clearly identifies me as a UX/Product Designer and states my strengths.
- ■ The first project is relevant to the roles I want.
- ■ Project cards and case study pages load correctly.
- ■ The portfolio is readable on a phone and desktop.
- ■ The CV, contact details, and links work.
- ■ Each case study makes my personal contribution easy to distinguish from the team's work.
- ■ I can explain every major decision in an interview.

10. Final reminders

• Do not redesign the whole Taggo product just to make the portfolio stronger.

• Do not invent interviews, surveys, user quotes, usability findings, percentages, or business outcomes.

• Use competitor analysis as evidence of your review, not proof that competitors are objectively bad.

• If confidential company information is involved, anonymize it and get permission before publishing sensitive screens or metrics.

• A strong case study makes the reasoning visible: problem → evidence → decision → design → validation or next test.

Your next action: gather the Taggo screens and notes you already have. Start with the overview and problem statement; complete the workbook in small sessions rather than trying to write everything at once.
