Project Impact & Key Metrics

The measurable outcomes and business impact of the Taggo platform design.

Booking Time	**< 30s**	From app open to ride confirmed
Driver Avg. Rating	**4.8 ★**	AI-powered driver matching
UAE Coverage	**7 Emirates**	Full coverage with Arabic support
Hidden Fees	**0%**	Transparent fixed-rate pricing
Screens Designed	**70+**	User App + Driver App + Components
Revenue Potential	**3.5×**	Rides, rental, cargo streams

Tools & Process

I owned the entire design workflow — from initial user research and competitive analysis through visual design, prototyping, usability testing, and annotated developer handoff. Every deliverable was created and maintained by me as the sole designer.

END-TO-END DESIGN WORKFLOW

Design Process

Research → IA & Flows → Lo-Fi Wireframes → Visual Design → Prototyping → Usability Testing → Iteration → Design System → Dev Handoff

Tools Used

→ Figma — UI/UX design, components, prototyping
→ FigJam — user flows, journey maps, brainstorming
→ Maze — remote usability testing (3 rounds)
→ Notion — design documentation & specs
→ Lottie — micro-animation specs for developers

Deliverables

Key Takeaways

This project stretched my skills across research, IA, visual design, and dev collaboration. Working as the sole designer on a complex multi-service platform taught me to be strategic about scope, rigorous about testing, and pragmatic about component reuse.

REFLECTIONS

What I Learned

- Designing a multi-service platform requires strong information architecture — IA testing early saved major rework later
- UAE-first localization is more than translation — RTL layouts, prayer time considerations, and Dirham currency formatting needed dedicated design passes
- Component-driven design paid off at scale — 50+ reusable components meant faster iteration and developer consistency
- Usability testing with real UAE commuters revealed that cash-first payment flow was essential (not an afterthought)
- Driver app required a completely different design lens — one-handed use, glanceable info, and audio feedback patterns

What I'd Do Differently

- Start with a design token system from day one instead of retrofitting
- Run more driver-side testing earlier — driver needs were underrepresented in initial research
- Build in accessibility audits at the component level rather than page level
