Impact & Metrics

Quantifiable deliverables and design outcomes that demonstrate the scope, depth, and quality of this project.

Deliverable Metrics

100+
Screens Designed
High-fidelity, dev-ready mockups

5
User Portals
End-to-end experience per role

92
Design Tokens
Scalable variable system

6
Token Collections
Full design system foundation

7
Booking Steps
Complete flow + edge cases

11
Core Components
Reusable across all portals

4
RTL Screens
Arabic localization ready

2
Theme Modes
Light & Dark mode tokens

Design Impact

Complete Product Ownership

Sole designer responsible for the entire product — from initial research and strategy through final dev handoff. Every screen, component, and token designed by one person.

Scalable Design System

Built a token-based design system from scratch supporting theming (light/dark), internationalization (LTR/RTL), and scales across 5 distinct user portals.

Full-Spectrum UX Coverage

Designed not just happy paths but comprehensive edge cases — empty states, error handling, payment failures, slot unavailability, validation states, and loading patterns.

Accessibility & Localization

Proactively designed RTL Arabic layouts and keyboard focus state specifications — ensuring the platform is accessible and globally ready from day one.

Process & Methodology

Research Phase

- User interviews and competitive analysis across healthcare booking platforms
- Persona development for 4 distinct user roles (Patient, Clinic, Doctor, Admin)
- Journey mapping to identify key touchpoints and pain points
- Information architecture and content strategy definition

Design Phase

- Wireframing all key flows before moving to high-fidelity
- Iterative design with progressive refinement across all portals
- Design system built in parallel with screen design for consistency
- Micro-interaction and state design for polished user experience

Handoff Phase

- Component documentation with usage guidelines
- Interactive prototypes for developer reference
- Design token export ready for engineering implementation
- Accessibility annotations and keyboard navigation specs
